Highlights

Industrial product and raw materials price indexes

Manufacturers' prices were up 1.3% in July but down 1.6% on an annual basis, largely due to the effect of the Canadian dollar against the US dollar. If the impact of the Canadian dollar is removed, the Industrial Product Price Index (IPPI) would have risen 1.0% rather than falling 1.6% from the previous year.

Petroleum product prices have less influence on the IPPI

12-month % change

From a monthly perspective, higher prices for motor vehicles and other transport equipment (+2.9%), lumber and other wood products (+3.6%) and primary metal products (+2.3%) were the major contributors to the increase in the IPPI. Prices for petroleum products also rose (+1.6%), as well as those for electrical and communication products (+1.7%). However, prices for meat, fish and dairy products were down 2.4% from June. Lower prices for beef products were responsible for this decrease, the result of the impact of last May's detection of a single case of bovine spongiform encephalopathy (BSE), or mad cow disease.

On an annual basis, lower prices for motor vehicles and other transport equipment (-6.2%), lumber and other wood products (-4.3%) and electrical and communication products (-4.0%) were the major contributors to the year-over-year decline in the IPPI.

The petroleum and coal products group continues to have a smaller influence on the year-over-year change in the IPPI than it did for the first four months of 2003, with an increase of 3.3%. If petroleum and coal product prices had been

excluded, the IPPI would have declined 2.0% instead of decreasing 1.6% on a year-over-year basis.

In addition to petroleum and coal products, prices for chemical products (+3.2%) as well as tobacco products (+19.6%) were also up compared with the previous year.

Lower cattle and calves prices push down raw materials prices

On a monthly basis, raw materials prices were down 1.5% from June. Animals and animal products were the major contributors to the monthly decrease in the Raw Materials Price Index (RMPI), with prices decreasing 10.1%. Prices for cattle and calves for slaughter declined 43.8% from June, reflecting the effect of the discovery last May of a single case of BSE, or mad cow disease, in Alberta. Lower prices for vegetable products as well as wood products also contributed to the decline. Mineral fuels increased slightly by 0.1% as crude oil prices remained unchanged from June. Higher prices for non-ferrous metals and ferrous materials partly offset the monthly decrease.

Manufacturers paid 2.4% less for their raw materials than they did in July last year, compared with an increase of 0.8% in June. Lower prices for animals and animal products (-14.2%) were mainly responsible for this annual drop in the RMPI. Prices for vegetable products, wood products and non-ferrous metals were also down on an annual basis. These decreases were partly offset by higher prices for mineral fuels (+5.6%) and non-metallic minerals (+5.8%). If mineral fuels had been excluded, the RMPI would have decreased 8.6%.

The IPPI (1997=100) stood at 105.3 in July, up from its revised level of 104.0 in June. The RMPI (1997=100) was 110.0 in July down from its revised level of 111.7 in June.

Crude oil prices still influence the RMPI

12-month % change

Impact of exchange rate

Between June and July, the value of the US dollar strengthened against the Canadian dollar, pushing up prices of commodities that are quoted in US dollars, notably motor vehicles and lumber products. As a result, the total IPPI excluding the effect of the exchange rate would have edged up 0.1% instead of increasing 1.3%.

However, on a 12-month basis, the Canadian dollar is much stronger. Consequently, the IPPI excluding the effect of the exchange rate would have increased 1.0% rather than declining 1.6% from July 2002 to July 2003.

Prices for intermediate goods decrease on an annual basis

Prices for intermediate goods rose 1.1% from June. Higher prices for lumber products, motor vehicles, pulp and paper products, primary metal products as well as chemical products were the major contributors to the increase.

Producers of intermediate goods received 1.3% less for their goods in July compared with the same month last year. Lower prices for motor vehicles, lumber products, pulp and paper products, primary metal products as well as electrical and communication products were partially offset by higher prices for petroleum and chemical products.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Finished goods continue to decrease from a year ago

On a monthly basis, prices for finished goods were up 1.5% from June. Higher prices for motor vehicles, petroleum products, electrical and communication products as well as machinery and equipment were the major contributors to this increase.

Declining prices for motor vehicles, electrical and communication products, machinery and equipment as well as pulp and paper products pushed year-over-year prices down 2.1% from July 2002. These decreases were partly offset by higher prices for tobacco products, fruit, vegetable and feed products, chemical products as well as petroleum products.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies, or governments. Much of the remainder is bought by consumers.

Note to readers

The **Industrial Product Price Index** (IPPI) reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI.

The **Raw Materials Price Index** (RMPI) reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

- 1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor. The numeric descriptor is of the order ss-mm-nn-pppp-rr where
- ss indicates the S-level commodity code (from 9 to 28)
 - mm indicates the M-level commodity code (from 14 to 43, 45 to 69)
 - nn indicates the M-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details
 - pppp indicates the PCGA code (except for some special aggregations which include several PCGAs)
 - rr indicates a split of a PCGA.

- 1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.
- 2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are «must take» respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the «Make» matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

Reference Documents

62-558-XPB Industry Price Indexes, 1986=100: Users' Guide, \$40.00.

This publication describes briefly the economic content of the series and presents a short description of different aggregations produced. In the tables the weighting patterns (1986) for both commodities and commodity groupings are shown. Descriptions of the characteristics of the elemental indexes are provided. Comments on index use are also provided.

62-556-XPB Industrial Product Price Indexes, 1981=100, Concepts and Methods, \$25.00.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's The Daily approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.

Highlights

Industrial product and raw materials price indexes

Manufacturers' prices were up 0.3% in August, but down 2.0% on an annual basis, largely because of the continuing effect of a strong Canadian dollar against the US dollar. Without the dollar's influence, the Industrial Product Price Index (IPPI) would have risen 1.1% rather than falling 2.0% from a year ago.

Petroleum product prices have less influence on the IPPI

12-month % change

Like in July, higher prices for petroleum and coal products (+5.2%), lumber and other wood products (+1.7%), pulp and paper products (+0.7%) and primary metal products (+0.5%) were the major contributors to the monthly increase in the IPPI, while the prices for meat, fish and dairy products continued to fall (-1.5%) as a result of lower prices for beef products. Unlike in July, prices for motor vehicles and other transport equipment fell 0.4%, mainly because of the effect of the exchange rate.

On an annual basis, this represents the fifth consecutive month of decline in the IPPI. The enduring lower prices for motor vehicles and other transport equipment (-7.5%), electrical and communication products (-4.9%), pulp and paper products (-3.3%), meat, fish and dairy products (-2.0%) as well as primary metal products (-1.7%) remain the major contributors to the year-over-year decline in the IPPI.

The petroleum and coal products group, with an increase of 4.4%, continues to have a smaller influence on the year-over-year change in the IPPI than it did for the first four months of 2003. If petroleum and coal product prices had been excluded, the IPPI would have declined 2.4% instead of decreasing 2.0% on a year-over-year basis.

In addition to petroleum and coal products, prices for tobacco products (+19.6%) and chemical products (+1.7%) were also up from August 2002.

Higher crude oil prices push up raw materials prices

Raw materials prices were up 1.1% from July. Mineral fuels were the major contributors to the monthly increase in the Raw Materials Price Index (RMPI), with prices increasing 2.1%. Higher prices for wood products (+0.8%) and non-ferrous metals (+0.6%) also contributed to the monthly rise. Lower prices for animal products partly offset this increase.

Manufacturers paid 3.0% less for their raw materials than they did in August 2002, compared with a decrease of 2.6% in July. Lower prices for animals and animal products (-15.0%) were mainly responsible for this annual drop in the RMPI. Prices for vegetable products and wood products were also down on an annual basis. These decreases were partly offset by higher prices for mineral fuels (+4.4%), non-ferrous metals (+2.7%) and non-metallic minerals (+5.9%). If mineral fuels had been excluded, the RMPI would have decreased 8.8%.

The IPPI (1997=100) stood at 105.6 in August, up from its revised level of 105.3 in July. The RMPI (1997=100) was 111.0 in August up from its revised level of 109.8 in July.

Crude oil prices continue to influence the RMPI

12-month % change

Impact of exchange rate

From July to August, the value of the US dollar weakened slightly against the Canadian dollar, pushing down prices of commodities that are quoted in US dollars, notably motor vehicles and lumber products. As a result, the total IPPI excluding the effect of the exchange rate would have risen 0.4% instead of increasing 0.3%.

However, on a 12-month basis, the influence of the dollar is much stronger. Consequently, the IPPI excluding the effect of the exchange rate would have increased 1.1% rather than declining 2.0% from August 2002 to August 2003.

Prices for intermediate goods continue to decrease on an annual basis

Prices for intermediate goods rose 0.5% from July. Higher prices for petroleum products, lumber products, pulp and paper products as well as primary metal products were the major contributors to the increase.

Producers of intermediate goods received 1.4% less for their goods in August than in August 2002. Lower prices for motor vehicles, pulp and paper products, primary metal products, electrical and communication products as well as lumber products were partly offset by higher prices for petroleum and chemical products.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Finished goods decrease again from a year ago

On a monthly basis, prices for finished goods edged up 0.1% from July. Higher prices for petroleum and lumber products were offset by lower prices for meat, dish and dairy products as well as motor vehicles.

Declining prices for motor vehicles, pulp and paper products as well as electrical and communication products pushed year-over-year prices down 2.8% from August 2002. These decreases were partly offset by higher prices for tobacco products, fruit, vegetable and feed products, petroleum products as well as chemical products.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies, or governments. Much of the remainder is bought by consumers.

Note to readers

The **Industrial Product Price Index (IPPI)** reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI.

The **Raw Materials Price Index (RMPI)** reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

Note: Indexes for the most recent six months shown are subject to revision.

1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor.

The numeric descriptor is of the order ss-mm-nn-pppp-rr where

ss indicates the S-level commodity code (from 9 to 28)

mm indicates the M-level commodity code (from 14 to 43, 45 to 69)

nn indicates the N-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details

pppp indicates the PCGA code (except for some special aggregations which include several PCGAs)

rr indicates a split of a PCGA.

Note: Indexes for the most recent six months shown are subject to revision.

1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.

2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are "must take" respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the "Make" matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w^i are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

This publication describes briefly the economic content of the series and presents a short description of different aggregations produced. In the tables the weighting patterns (1986) for both commodities and commodity groupings are shown. Descriptions of the characteristics of the elemental indexes are provided. Comments on index use are also provided.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's The Daily approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.

Discover WHO HOLDS THE BALANCE OF POWER IN CANADA

INTER-CORPORATE OWNERSHIP

TAKEOVERS. MERGERS. ACQUISITIONS.

Business moves at the speed of light. Change is accelerating. Keeping up can be exhausting.

HERE'S THE GOOD NEWS.

With *Inter-Corporate Ownership (ICO)*, there's no quicker or easier way to get the inside track on competitors or customers! With over 95,000 company listings of both Canadian and foreign-owned firms integrated into one source, *ICO* saves you valuable research time. Canada's premiere resource on corporate ownership contains tens of thousands more listings than any other source. Discover:

- ▶ who owns and controls which companies
- ▶ to which industry they belong
- ▶ how they fit in the company hierarchy
- ▶ province of residence of head office
- ▶ percentage of voting rights owned
- ▶ country of control
- ▶ and much, much more.

Meticulously researched and compiled by our trusted experts and analysts, *ICO* is an indispensable resource for lawyers, financial analysts, journalists, bankers, economists, investors, trade analysts, policy makers, lobbyists, corporate executives, academics and researchers.

USE *INTER-CORPORATE OWNERSHIP* TO:

- ▶ Discover business opportunities through corporate structure information.
- ▶ Tap into new markets by identifying potential new corporate customers for your products.
- ▶ Uncover export opportunities by charting changes in foreign control.
- ▶ Zero in on potential customers by determining which corporations are active in different provinces and regions.

Highlights

Industrial product and raw materials price indexes

Manufacturers' prices were up 0.2% in September, marking three consecutive months of increase. Compared with September 2002, however, prices were down 2.6%, largely because of the continuing effect of a strong Canadian dollar against the US dollar. Without the dollar's influence, the Industrial Product Price Index (IPPI) would have risen 1.3% rather than falling 2.6% from a year ago.

Petroleum product prices have less influence on the IPPI

12-month % change

On a monthly basis, lumber and other wood products were up 7.2% from August. Increasing prices for softwood lumber and particleboard were responsible for this rise, reflecting improved demand and a tight supply. Higher prices for meat, fish and dairy products (+1.0%), chemical products (+0.8%) and fruit, vegetable and feed products (+0.7%) also contributed to the monthly increase in the IPPI. Prices for motor vehicles and other transport equipment continued to fall (-0.9%), mainly because of the effect of the exchange rate. Lower prices were also observed for petroleum and coal products (-2.0%), pulp and paper products (-1.0%) and electrical and communication products (-0.8%).

On an annual basis, September was the sixth consecutive month of decline in the IPPI. Lower prices persisted for motor vehicles and other transport equipment (-9.4%), pulp and paper products (-5.2%), electrical and communication products (-6.9%) and primary metal products (-2.5%). These products remain the major contributors to the year-over-year decline in the IPPI.

The petroleum and coal products group continues to have a smaller influence on the year-over-year change in the IPPI, with an increase of 0.8%. If petroleum and coal product prices had been excluded, the IPPI would have declined 2.9% instead of 2.6% on a year-over-year basis.

In addition to petroleum and coal products, prices for lumber and other wood products (+8.0%), tobacco products (+15.7%), beverage products (+3.1%) and chemical products (+0.5%) were also up from September 2002.

Lower crude oil prices push down raw materials prices

On a monthly basis, raw materials prices were down 3.1% from August. Mineral fuels were the major contributors to the monthly decrease in the Raw Materials Price Index (RMPI), with prices declining 10.4%. Higher prices for animals and animal products (+9.7%), more specifically cattle and calves for slaughter, and wood products (+1.9%) partly offset this decrease.

Manufacturers paid 8.3% less for their raw materials than they did in September 2002, compared with a decrease of 2.8% in August. Lower prices for mineral fuels (-11.2%) were mainly responsible for this annual drop in the RMPI. Prices for vegetable products (-19.0%), wood products (-7.1%) and animals and animal products (-3.4%) were also down on an annual basis. These decreases were partly offset by higher prices for non-metallic minerals (+4.7%). If mineral fuels had been excluded, the RMPI would have decreased 6.0%.

The IPPI (1997=100) stood at 105.9 in September, up from its revised level of 105.7 in August. The RMPI (1997=100) was 107.7 in September down from its revised level of 111.2 in August.

Crude oil prices continue to influence the RMPI

12-month % change

Impact of exchange rate

From August to September, the value of the US dollar weakened against the Canadian dollar, pushing down prices of commodities that are quoted in US dollars, notably motor vehicles and lumber products. As a result, the total IPPI excluding the effect of the exchange rate would have risen 0.6% instead of 0.2%.

However, on a 12-month basis, the influence of the dollar is much stronger. Consequently, the IPPI excluding the effect of the exchange rate would have increased 1.3% rather than declining 2.6% from September 2002 to September 2003.

Prices for intermediate goods continue to decrease on an annual basis

Prices for intermediate goods rose 0.5% from August. Higher prices for lumber products, fruit, vegetable and feed products, meat, fish and dairy products, and primary metal products were the major contributors to the increase. Lower prices for petroleum products, pulp and paper products, and motor vehicles partly offset this increase.

Producers of intermediate goods received 1.7% less for their goods in September than in September 2002. Lower prices for motor vehicles, pulp and paper products, electrical and communication products, primary metal products, and fruit, vegetable and feed products were partly offset by higher prices for lumber products.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Finished goods decrease again from a year ago

On a monthly basis, prices for finished goods were down 0.4% from August. Lower prices for motor vehicles, petroleum products, and electrical and communication products were partly offset by higher prices for lumber products.

Declining prices for motor vehicles, pulp and paper products, machinery and equipment, and electrical and communication products pushed year-over-year prices down 3.8% from September 2002. These decreases were partly offset by higher prices for tobacco products, petroleum products, and chemical products.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies or governments. Much of the remainder is bought by consumers.

Note to readers

The **Industrial Product Price Index** (IPPI) reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI.

The **Raw Materials Price Index** (RMPI) reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

- 1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor. The numeric descriptor is of the order ss-mm-nn-pppp-rr where
- ss indicates the S-level commodity code (from 9 to 28)
 - mm indicates the M-level commodity code (from 14 to 43, 45 to 69)
 - nn indicates the N-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details
 - pppp indicates the PCGA code (except for some special aggregations which include several PGAs)
 - rr indicates a split of a PCGA.

Note: Indexes for the most recent six months shown are subject to revision.

- 1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.
- 2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are "must take" respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the "Make" matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w^i are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

Reference Documents

62-558-XPB Industry Price Indexes, 1986=100: Users' Guide, \$40.00.

This publication describes briefly the economic content of the series and presents a short description of different aggregations produced. In the tables the weighting patterns (1986) for both commodities and commodity groupings are shown. Descriptions of the characteristics of the elemental indexes are provided. Comments on index use are also provided.

62-556-XPB Industrial Product Price Indexes, 1981=100, Concepts and Methods, \$25.00.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's *The Daily* approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.

Highlights

Industrial Product and Raw Materials Price Indexes

Manufacturers' prices were down 0.9% in October, following three months of increase. Compared with October 2002, prices were down 3.8%, largely as a result of the continuing effect of a strong Canadian dollar against the US dollar. Without the dollar's influence, the Industrial Product Price Index (IPPI) would have risen 0.9% rather than falling 3.8%.

Declining influence of petroleum products on the IPPI

12-month % change

On a monthly basis, prices for motor vehicles and other transport equipment continued to fall (-1.7%), mainly because of the effect of the exchange rate. Lumber and other wood products were down 3.4% from September. Decreasing prices for softwood lumber as a result of higher inventories were responsible for this drop. Lower prices were also observed for petroleum and coal products (-2.7%), pulp and paper products (-1.1%), electrical and communication products (-1.3%) and chemical products (-0.6%).

On a year-over-year basis, October is the seventh consecutive month of decline in the IPPI. Lower prices persisted for motor vehicles and other transport equipment (-11.0%), pulp and paper products (-6.7%), electrical and communication products (-8.4%) and primary metal products (-2.0%). These products remain the major contributors to the year-over-year decline in the IPPI.

The petroleum and coal products group had a much smaller influence on the year-over-year change in the IPPI, with a decrease of 5.0%. If petroleum and coal product prices had been excluded, the IPPI would have declined 3.7% instead of 3.8% on a year-over-year basis.

Higher prices for lumber and other wood products (+4.5%), tobacco products (+15.1%), chemical products (+0.6%), furniture and fixtures (+2.3%) and beverage products (+1.9%) partly offset the annual decline.

Higher crude oil prices push up raw materials prices

On a monthly basis, raw materials prices were up 1.1% from September. Mineral fuels were the major contributors to the monthly increase in the Raw Materials Price Index (RMPI), with prices rising 2.2%. Crude oil prices rose 2.9% from September, as OPEC announced plans to cut production. Higher prices for non-ferrous metals (+2.9%) and wood products (+0.5%) also contributed to this increase. Lower prices for vegetable products (-0.8%), animals and animal products (-0.3%) and ferrous materials (-1.8%) had a dampening effect on the monthly increase.

Manufacturers paid 7.8% less for their raw materials than they did in October 2002, compared with a decrease of 8.9% in September. Lower prices for mineral fuels (-9.5%) were responsible for more than half of this annual drop in the RMPI. Prices for vegetable products (-17.6%), animals and animal products (-6.7%) and wood products (-8.0%) were also down on an annual basis. These decreases were partly offset by higher prices for non-ferrous metals (+3.5%) and non-metallic minerals (+2.6%). If mineral fuels had been excluded, the RMPI would have decreased 6.4%.

The IPPI (1997=100) stood at 104.9 in October, down from its revised level of 105.8 in September. The RMPI (1997=100) was 108.3 in October up from its revised level of 107.1 in September.

Crude oil prices continue to influence the RMPI

12-month % change

Impact of exchange rate

From September to October, the value of the US dollar weakened against the Canadian dollar, pushing down prices of commodities that are quoted in US dollars, notably motor vehicles and lumber products. As a result, the total IPPI excluding the effect of the exchange rate would have remained unchanged instead of decreasing 0.9%.

However, on a 12-month basis, the influence of the dollar is much stronger. Consequently, the IPPI excluding the effect of the exchange rate would have increased 0.9% rather than declining 3.8% from October 2002 to October 2003.

Prices for intermediate goods continue to decrease on an annual basis

Prices for intermediate goods declined 0.8% from September. Lower prices for lumber products, motor vehicles, pulp and paper products as well as petroleum products were the major contributors to the decrease.

Producers of intermediate goods received 2.7% less for their goods in October than in October 2002. Lower prices for motor vehicles, pulp and paper products, electrical and communication products, petroleum products as well as primary metal products were partly offset by higher prices for lumber products.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Finished goods decrease again from a year ago

On a monthly basis, prices for finished goods were down 1.0% from September. Lower prices for motor vehicles, petroleum products as well as electrical and communication products were partly offset by higher prices for lumber products and meat, fish and dairy products.

Declining prices for motor vehicles, petroleum products, electrical and communication products, machinery and equipment as well as pulp and paper products pushed year-over-year prices down 5.2% from October 2002. These decreases were partly offset by higher prices for tobacco products, chemical products as well as furniture and fixtures.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies, or governments. Much of the remainder is bought by consumers.

Note to readers

The **Industrial Product Price Index** (IPPI) reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI.

The **Raw Materials Price Index** (RMPI) reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

Note: Indexes for the most recent six months shown are subject to revision.

1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor.

The numeric descriptor is of the order ss-mm-nn-pppp-rr where

ss indicates the S-level commodity code (from 9 to 28)

mm indicates the M-level commodity code (from 14 to 43, 45 to 69)

nn indicates the M-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details

pppp indicates the PCGA code (except for some special aggregations which include several PCGAs)

rr indicates a split of a PCGA.

Note: Indexes for the most recent six months shown are subject to revision.

1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.

2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are "must take" respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the "Make" matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w^i are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum_i w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

This publication describes briefly the economic content of the series and presents a short description of different aggregations produced. In the tables the weighting patterns (1986) for both commodities and commodity groupings are shown. Descriptions of the characteristics of the elemental indexes are provided. Comments on index use are also provided.

62-556-XPB Industrial Product Price Indexes, 1981=100, Concepts and Methods, \$25.00.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's The Daily approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.

Profiling Corporate Canada... one community at a time

In the new economy where business is fueled by information, you need accurate, timely and comprehensive data to capture the complete perspective.

Nothing helps you leverage the power of information to profile Canada's business community faster, simpler or more effectively than the *Canadian Business Patterns (CBP)*.

This unique research tool provides detailed and reliable counts of business establishments by:

- nine employment size ranges
- geography groupings by province, metropolitan areas, census agglomerations, census divisions and census subdivisions
- and various levels of industry classification (SIC and NAICS).

Make better decisions — faster!

Use the *Canadian Business Patterns* to:

- study economic activity
- conduct administrative planning
- benchmark statistical surveys
- analyse economic change
- analyse market potential
- and much, much more!

Explore the world of business on disc

The CD-ROM *Canadian Business Patterns* provides you with the speed and reliability you need, combined with the freedom of flexibility you demand. Use the *CBP* to copy text right into your documents and databases, view data on a customized basis, and search, locate and print exactly what you are looking for.

Highlights

Industrial product and raw materials price indexes

Manufacturers' prices continue to weaken, down 0.4% in November following a decrease of 0.9% in October. Compared with November 2002, prices fell 4.0%, largely as a result of the continuing effect of a strong Canadian dollar against the US dollar.

Without the dollar's influence, the Industrial Product Price Index (IPPI) would have risen 1.0% rather than falling 4.0% from a year ago.

Declining influence of petroleum products on the IPPI

12-month % change

On a monthly basis, prices for motor vehicles and other transport equipment continued to fall (-1.2%), mainly due to the effect of the exchange rate. Lumber and other wood products were down 1.6% from October. Decreasing prices for softwood lumber were responsible for this drop, as inventories remained high.

Lower prices were also observed for petroleum and coal products (-1.2%), chemical products (-0.7%) as well as electrical and communication products (-0.6%).

Higher prices for primary metal products (+1.2%) as well as meat, fish and dairy products (+0.6%) partially offset the monthly decrease.

On a year-over-year basis, November represents the eighth consecutive month of decline in the IPPI. Lower prices persisted for motor vehicles and other transport equipment (-11.9%), electrical and communication products (-8.8%), pulp and paper products (-6.1%) as well as primary metal products (-2.0%). These products remain the major contributors to the year-over-year decline in the IPPI.

The petroleum and coal products group continued to have a much smaller influence on the year-over-year change in the IPPI with a decrease of 3.7%. If petroleum and coal product prices had been excluded, the IPPI would still have declined 4.0% on a year-over-year basis.

Higher prices for lumber and other wood products (+4.0%), tobacco products (+15.7%), beverages (+2.1%) as well as furniture and fixtures (+2.0%) partially offset the annual decline.

Higher crude oil prices push up prices of raw materials

On a monthly basis, raw materials prices were up 1.5% from October. Mineral fuels were responsible for about half of the monthly increase in the Raw Materials Price Index (RMPI), with prices rising 1.6%.

Crude oil prices rose 2.1% from October as a result of higher demand and tight inventories. Higher prices for non-ferrous metals (+3.2%), wood products (+2.3%) as well as vegetable products (+1.4%) also contributed to this increase.

Crude oil prices continue to influence the RMPI

12-month % change

Manufacturers paid 3.2% less for their raw materials than they did in November 2002, compared with a decrease of 7.5% in October. Lower prices for vegetable products (-17.5%), animals and animal products (-6.9%) and wood products (-6.0%) were the major contributors to this annual drop in the RMPI.

These decreases were partly offset by higher prices for non-ferrous metals (+5.2%), non-metallic minerals (+3.2%) and ferrous materials (+1.4%). Mineral fuels were down 0.1% from a year ago with lower prices for crude oil being offset by higher prices for natural gas. If mineral fuels had been excluded, the RMPI would have decreased 5.5%.

The IPPI (1997=100) stood at 104.4 in November, down from its revised level of 104.8 in October. The RMPI (1997=100) was 110.3 in November, up from its revised level of 108.7 in October.

Impact of exchange rate

Between October and November, the value of the U.S. dollar continue to weakened against the Canadian dollar, pushing down prices of commodities that are quoted in U.S. dollars, notably motor vehicles and lumber products. As a result, the total IPPI excluding the effect of the exchange rate would have risen 0.1% instead of decreasing 0.4%.

However, on a 12-month basis, the influence of the dollar is much stronger. Consequently, the IPPI excluding the effect of the exchange rate would have increased 1.0% rather than declining 4.0% from November 2002 to November 2003.

Prices for intermediate goods continue to decrease on an annual basis

Prices for intermediate goods declined 0.2% from October. Lower prices for lumber products, motor vehicles, petroleum products as well as chemical products were the major contributors to the decrease. Higher prices for primary metal products and fruit, vegetable and feed products partially offset this decrease.

Producers of intermediate goods received 2.8% less for their goods in November than in November 2002. Lower prices for motor vehicles, pulp and paper products, electrical and communication products, primary metal products as well as petroleum products were partly offset by higher prices for lumber products.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Finished goods decrease again from a year ago

On a monthly basis, prices for finished goods were down 0.6% from October. Lower prices for motor vehicles, petroleum products as well as electrical and communication products were partially offset by higher prices for meat, fish and dairy products.

Declining prices for motor vehicles, petroleum products, electrical and communication products as well as machinery and equipment pushed year-over-year prices down 5.5% from November 2002.

These decreases were partly offset by higher prices for tobacco products, fruit, vegetables and feed products, chemical products, beverages as well as furniture and fixtures.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies, or governments. Much of the remainder is bought by consumers.

Note to readers

The *Industrial Product Price Index (IPPI)* reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its U.S. counterpart affects the IPPI.

The *Raw Materials Price Index (RMPI)* reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

Note: Indexes for the most recent six months shown are subject to revision.

1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor.

The numeric descriptor is of the order ss-mm-nn-pppp-rr where

ss indicates the S-level commodity code (from 9 to 28)

mm indicates the M-level commodity code (from 14 to 43, 45 to 69)

nn indicates the M-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details

pppp indicates the PCGA code (except for some special aggregations which include several PCGAs)

rr indicates a split of a PCGA.

Note: Indexes for the most recent six months shown are subject to revision.

- 1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.
- 2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are «must take» respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the «Make» matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w^i are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

This publication describes briefly the economic content of the series and presents a short description of different aggregations produced. In the tables the weighting patterns (1986) for both commodities and commodity groupings are shown. Descriptions of the characteristics of the elemental indexes are provided. Comments on index use are also provided.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's The Daily approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.

Highlights

Industrial product and raw materials price indexes

Manufacturers' prices were up 0.3% in December following two months of decrease. Compared with December 2002, prices fell 3.4%, largely as a result of the continuing effect of a strong Canadian dollar against the US dollar.

Declining influence of petroleum products on the IPPI

12-month % change

Without the dollar's influence, the Industrial Product Price Index (IPPI) would have risen 1.0% rather than falling 3.4% from a year ago.

On a monthly basis, prices for primary metal products were up 2.3%, the result of higher prices for nickel, silver and gold. Motor vehicles and other transport equipment increased 0.5%, mainly the result of the effect of the exchange rate.

Higher prices were also observed for petroleum and coal products (+1.6%), electrical and communication products (+0.3%) as well as meat, fish and dairy products (+0.2%).

Lumber and other wood products were down 3.6% from November. Decreasing prices for particleboard and softwood plywood were responsible for this drop, as demand declined for these products.

On a 12-month basis, December represents the ninth consecutive month of decline in the IPPI. Lower prices persisted for motor vehicles and other transport equipment (-10.6%), electrical and communication products (-7.7%) and pulp and paper products (-5.2%). These products remain the major contributors to the 12-month decline in the IPPI.

The petroleum and coal products group continued to have a much smaller influence on the 12-month change in the IPPI, with a decrease of 3.0%. If petroleum and coal product prices had been excluded, the IPPI would have declined 3.6% on a 12-month basis.

Higher prices for tobacco products (+14.2%), beverages (+2.4%) and furniture and fixtures (+1.6%) partly offset the decline.

Higher crude oil prices push up prices of raw materials

On a monthly basis, raw materials prices were up 2.4% from November. Mineral fuels prices, up 3.2%, were responsible for more than half of the monthly increase in the Raw Materials Price Index (RMPI).

Crude oil prices rose 4.3% from November as a result of strong demand and low inventories. Higher prices for non-ferrous metals (+4.5%), animals and animal products (+1.0%), vegetable products (+1.9%) as well as wood products (+1.2%) also contributed to this increase.

Manufacturers paid 5.1% less for their raw materials than they did in December 2002, compared with a decrease of 3.2% in November. Mineral fuels were down 6.7% from a year ago, with crude oil prices declining 8.5%. If mineral fuels had been excluded, the RMPI would have decreased 3.9%.

Crude oil prices have less influence on the RMPI

12-month % change

Lower prices for animals and animal products (-7.7%), vegetable products (-14.2%) and wood products (-5.0%) also contributed to the 12-month drop in the RMPI.

These decreases were partly offset by higher prices for non-ferrous metals (+10.7%), ferrous materials (+4.7%) and non-metallic minerals (+4.4%).

The IPPI (1997=100) stood at 104.6 in December, up from its revised level of 104.3 in November. The RMPI (1997=100) was 113.0 in December up from its revised level of 110.3 in November.

Impact of exchange rate

From November to December, the value of the US dollar strengthened against the Canadian dollar, pushing up prices of commodities that are quoted in US dollars, notably motor vehicles, lumber products and pulp and paper products. As a result, the total IPPI excluding the effect of the exchange rate would have risen 0.1% instead of 0.3%.

On a 12-month basis, however, the influence of the dollar is much stronger. Consequently, the IPPI excluding the effect of the exchange rate would have increased 1.0% rather than declining 3.4% from December 2002 to December 2003.

Prices for intermediate goods continue to decrease on an annual basis

Prices for intermediate goods were up 0.2% from November. Higher prices for primary metal products, petroleum and coal products, motor vehicles as well as meat, fish and dairy products were the major contributors to the increase.

Lower prices for lumber products, pulp and paper products, chemical products as well as fruit, vegetable and feed products partly offset this increase.

Producers of intermediate goods received 2.4% less for their goods in December 2003 than in December 2002. Lower prices for motor vehicles, pulp and paper products, electrical and communication products, primary metal products as well as petroleum products were mainly responsible for the annual decline.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Finished goods decrease again from a year ago

On a monthly basis, prices for finished goods were up 0.3% from November. Higher prices for motor vehicles and petroleum products were partly offset by lower prices lumber products.

Declining prices for motor vehicles, petroleum products, electrical and communication products, machinery and equipment as well as pulp and paper products pushed prices down 5.0% from December 2002.

These decreases were partly offset by higher prices for tobacco products, fruit, vegetables and feed products, chemical products, beverages as well as furniture and fixtures.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies, or governments. Much of the remainder is bought by consumers.

Note to readers

The *Industrial Product Price Index (IPPI)* reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI.

The *Raw Materials Price Index (RMPI)* reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

- 1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor. The numeric descriptor is of the order ss-mm-nn-pppp-rr where
- ss indicates the S-level commodity code (from 9 to 28)
 - mm indicates the M-level commodity code (from 14 to 43, 45 to 69)
 - nn indicates the M-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details
 - pppp indicates the PCGA code (except for some special aggregations which include several PCGAs)
 - rr indicates a split of a PCGA.

- 1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.
- 2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are "must take" respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the "Make" matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w^i are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum_i w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

This publication describes briefly the economic content of the series and presents a short description of different aggregations produced. In the tables the weighting patterns (1986) for both commodities and commodity groupings are shown. Descriptions of the characteristics of the elemental indexes are provided. Comments on index use are also provided.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's *The Daily* approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.
